GREENSMECAPT Conference Demonstration Pack

Two-company, mixed-format evidence dossier

All companies, people, accounts and values in this pack are fictional. The files are designed to exercise the implemented document, evidence, assessment and comparison workflow.

What the pack tests

Document	Format	Expected system route
01 utility bill	Image-only scanned PDF	Google Document AI OCR, then Gemini structured extraction
02 sustainability report	Born-digital narrative PDF	Native parsing, then Gemini structured extraction
03 financial and funding tables	Born-digital table-heavy PDF	Native/table parsing, then Gemini structured extraction

Designed evidence challenges

Each company has current and baseline environmental measures, denominators, financial statements, a funding request, projected savings and readiness observations. Each dossier also contains one deliberate electricity-value conflict, one incomplete claim and one useful item outside the scored metric catalog. These cases test source linking, conflict handling, missing-context treatment and discovery without forcing unsupported values into scoring.

Recommended demonstration order

Step	Action	Expected output
1	Create both SME records and upload all three files under the correct company.	Six separately traceable source documents
2	Wait for document processing and inspect evidence grouped by document.	OCR/native text, page provenance, extracted values and context
3	Resolve the deliberate conflict; accept review-ready evidence only.	Human-validated evidence ledger
4	Confirm company context and complete any genuinely missing assessment fields.	Environmental, financial and readiness inputs
5	Prepare, approve and publish both profiles; run investor comparison.	Green Score, financial view, evidence strength, readiness interpretation and MCDM comparison

Use ground_truth.json for extraction evaluation. It identifies authoritative values and the intended treatment of the deliberately conflicting or incomplete claims.
